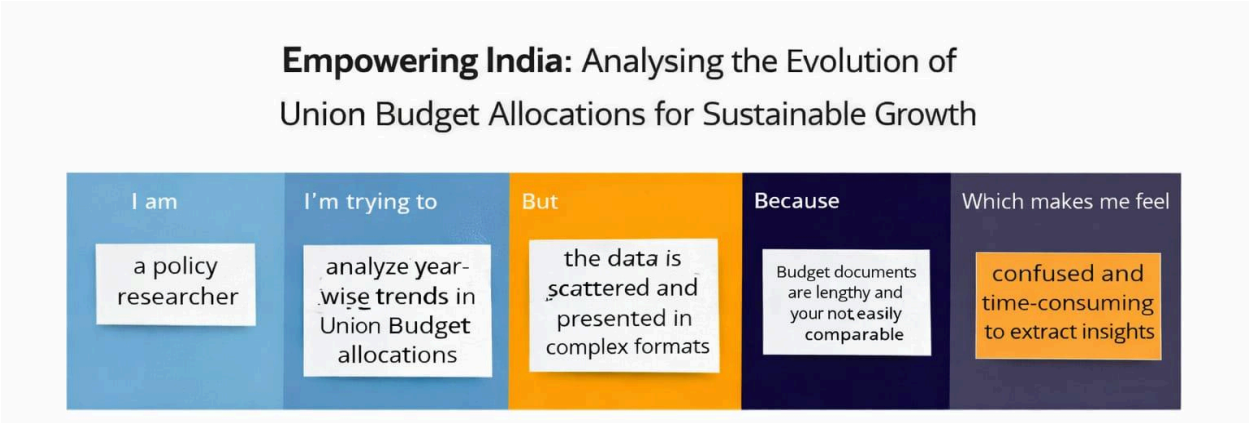
EXAMPLE:



Understanding the Problem from Multiple Perspectives

Problem Statement	I am a	I'm trying to	But	Because	Which makes me feel
PS-1	A policy researcher	Analyze trends in Union Budget allocations from 2021–2024	The data is scattered across multiple reports and formats	Budget documents are lengthy and not easily comparable year-wise	Confused and spending excessive time extracting insights
PS-2	A student / economics learner	Understand how government spending supports sustainable growth	I cannot clearly visualize sector-wise and scheme-wise allocation	Budget documents are highly technical and filled with financial terminology	Frustrated and dependent on secondary interpretations
PS-3	A concerned citizen	Understand government priorities in health, education, infrastructure,	Budget information is too complex to interpret	It is not presented in simple, user-friendly visual formats	Disconnected from policy decisions and public financial planning
PS-4	A data analyst	Identify allocation patterns and growth trends across departments	Raw data lacks structured visualization and comparison tools	There is no integrated dashboard to analyze multi-year budget trends	Motivated to build a clear, interactive data visualization system

PS-5	A financial analyst	Compare estimated vs actual expenditure across years	Data lacks clean comparative visualization	Financial statements are complex and not dashboard-ready	Inefficient in performing quick analysis
PS-6	A government official	Evaluate whether allocations align with sustainable development goals	Cross-departmental comparison is difficult	Budget data is presented ministry-wise without integrated sustainability mapping	Limited in measuring overall impact
PS-7	A journalist	Simplify budget insights for the public	Raw numbers are difficult to interpret quickly	Budget documents focus on figures rather than explanations	Challenged in presenting clear stories
